

MUSICA™ Technical Bulletin

Fixed or Variable Output

The *Musica* MU4602 keypad allows for either fixed or variable output when using an Audio Port. There are jumpers located on the inside of the keypad that are settable for either function. The default setting is for variable. If fixed is the desired function, changing the jumper will also by pass the amplifier section of the keypad and only the output of the Audio Port will be functional. The volume control from the keypad will no longer be functional.

After the jumpers have been set for fixed, the menus for the external output will also be non-functional.
